Gaspari Menotti Technologies lands in France with a Smartwire GMW 06 multiwire machine

Bretagne Granits, based in Le Hinglé Les Granits, in the north of France, is a company specialized in the processing of slabs with variable thickness which it obtains from blocks of various sizes.

The need to be flexible and to be able to cut any type of thickness led the Breton company to choose the Smartwire GMW 06 machine manufactured by Gaspari.

It is a machine that is both simple and revolutionary which, only recently introduced on the market by the Apuan company, has already

garnered a large number of approvals. The **Smartwire GMW 06** is designed to cut slabs of variable thickness starting from 20 mm and is studied to meet particular cutting needs thanks to a very simple and extremely precise system that allows to quickly change the required thickness ensuring the speed and working reliability typical of the Gaspari Menotti multiwire. All this is made possible by the innovative solutions adopted in the design phase, thanks to which the Smartwire GMW 06 can already **be considered a reference within its market** niche to satisfy the requests of customers, even the most demanding.
